143:120105 Nonaqueous gel composition for tooth whitening and tooth whitening set. Oniki, Takayuki; Uchiyama, Akira; Fukuda, Yasushi; Inoue, Shimako (Lion Corporation, Japan). PCT Int. Appl. WO 2005063182 A1 20050714, 36 pp. DESIGNATED STATES: W: AE, AG, AL, AM, AT, AU, AZ, BA, BB, BG, BR, BW, BY, BZ, CA, CH, CN, CO, CR, CU, CZ, DE, DK, DM, DZ, EC, EE, EG, ES, FI, GB, GD, GE, GH, GM, HR, HU, ID, IL, IN, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MA, MD, MG, MK, MN, MW, MX, MZ, NA, NI, NO, NZ, OM, PG, PH, PL, PT, RO, RU, SC, SD, SE, SG, SK, SL, SY, TJ, TM, TN, TR, TT, TZ, UA, UG, US, UZ, VC, VN, YU, ZA, ZM, ZW; RW: AT, BE, BF, BJ, CF, CG, CH, CI, CM, CY, DE, DK, ES, FI, FR, GA, GB, GR, IE, IS, IT, LU, MC, ML, MR, NE, NL, PT, SE, SN, TD, TG, TR. (Japanese). CODEN: PIXXD2. APPLICATION: WO 2004-JP19344 20041224. PRIORITY: JP 2003-432095 20031226.

AB A nonaq. gel compn. for tooth whitening, comprises: (A) a tooth whitening component of 17.0 to 43.0 specific inductive capacity

(25°C) and 0 to 7000 kPa vapor pressure (25°C), (B) a substance that is sol. in the tooth whitening component and is pptd. by an aq. soln. of calcium chloride, and (C) a gelling agent. The compn. contains substantially none of water and peroxides. This tooth whitening component can penetrate into the enamel surface layer of teeth to thereby alter the optical properties, such as refractive index and reflectance, of the enamel so that the enamel is apparently whitened. The whitened teeth can be restored to the original tooth color in a reversible manner in the presence of water. Further, the persistence of reversible whitening effect can be strikingly enhanced by the nonaq. gel compn. For example, a tooth-whitening gel compn. contained propylene glycol 43.5, isopropanol 24.99, ethanol 24, Ultrahold strong 1, Na lauryl sulfate 3, myristic acid diethanolamide 1, carboxyvinyl polymer 1, flavors 1, NaOH 0.01, and stevioside 0.5 %.

86:40206 Constituent acids of soft resin from shellac. Chatterjea, J.
 N.; Sengupta, S. C.; Misra, G. S.; Agarwal, S. C. (Indian Lac Res.
 Inst., Ranchi, India). Indian Journal of Chemistry, Section B:
 Organic Chemistry Including Medicinal Chemistry, 14B(9), 719-21
 (English) **1976**. CODEN: IJSBDB. ISSN: 0376-4699.

AB About 90% of the constituents of soft resin from palas **seed**
 -lac were isolated by chromatog. techniques and identified. The
 results show that the terpenic and aliph. acids are present roughly
 in a 50:50 ratio. 10,16-Dihydroxyhexadecanoic acid was isolated for
 the first time from soft resin.

74:23771 Chemistry of lac resin. IV. Pure lac resin. 1. Isolation and quantitative determination of constituent acids. Upadhye, Ajitnath B.; Wadia, Murzban S.; Mhaskar, Vyankatesh V.; Dev, Sukh (Nat. Chem. Lab., Poona, India). Tetrahedron, 26(17), 4177-87 (English) **1970**. CODEN: TETRAB. ISSN: 0040-4020.

AB From the hard resin of Palas (Butea frondosa) **seedlac**, an essentially pure lac resin fraction (termed pure lac resin) was isolated by the solvent pptn. method. Since some of the constituent acids of lac resin could not be estd. (as Me esters) by GLC (gas-liq. chromatog.), owing to decompn. on GLC columns, a semiquant. method for their estn., involving short-term hydrolysis, followed by oxidn. (CrO3), esterification, and GLC estn. of products, was developed. The pure lac resin mol. is derived from 3 mols. of aleuritic acid, 5 mols. of jalaric (**shellolic acid**), and 1 mol. of laccijalaric acid.

L35 ANSWER 1 OF 6 HCA COPYRIGHT 2006 ACS on STN

145:14124 Topical delivery system comprising esters of hydroxy acids for cosmetic and pharmaceutical agents. Gupta, Shyam K. (Bioderm Research, USA). U.S. Pat. Appl. Publ. US 2006110415 A1 20060525, 20 pp. (English).. CODEN: USXXCO. APPLICATION: US 2004-904665 20041122.

AB This invention relates to topical compns. contg. esters of hydroxy acids and their application in the deep-penetration delivery of beneficial cosmetic and pharmaceutical agents. An ester of a hydroxy acid is selected from alkyl and aryl esters of glycolic, malic, lactic, mandelic, ascorbic, phytic, salicylic, **aleuritic**, and tartaric **acids**, etc. Thus, a skin whitening serum was prepd. contg. Et lactate 20.0, hydroxypropyl guar 0.5,, quinacetophenone 5.0, PEG-6 70.0, arbutin 4.0, and preservatives 0.5 parts, resp. The product had a clear to slightly hazy serum-like appearance. It was absorbed rapidly with a silky smooth skin feel. Also, an arthritis pain relief anti-inflammatory gel was prepd. contg. tri-Et citrate 55.65, Polyamide-3 5.0, preservative 0.5, Boswellia serrata ext. 0.05, N-acetylglucosamine 2.0, methylsulfonylmethane 5.0, Aloe vera 0.1, vitamin E 0.5, paeonol 0.5, magnolol 0.2, chondroitin sulfat 0.5, and zeolite 30.0 parts, resp.

141:400499 Cosmetic and pharmaceutical ion-pair delivery system based
masks comprising biopolymer based films cross-linked with metal
cations. Gupta, Shyam K. (USA). U.S. Pat. Appl. Publ. US
2004219124 A1 **20041104**, 9 pp. (English). CODEN: USXXCO.
APPLICATION: US 2003-249701 20030501.

AB The present invention discloses a novel ion-pair delivery system
based mask compns. for face, hair, skin, and body applications.
These compns. come off from the site of their application
essentially in one piece with the appearance, for example, of a
piece of sea-weed or a continuous film. These mask compns. are
suitable for a variety of delivery system methods, such as peel-off
mask, moisturizing mask, exfoliating mask, prosthetic mask, soaking
mask, depilatory mask, rub-off mask, two-phase mask, two-compartment
mask, heat-releasing mask, and such. These mask compns. are made
from the biopolymer based films that are cross-linked with divalent
or trivalent metal cations. During the crosslinking process, such
divalent and trivalent metal cations may also act as release agents
for other face, hair, skin, and body beneficial compns. in their
enhanced bioavailable forms by an ion-pair activation mechanism.

L35 ANSWER 5 OF 6 HCA COPYRIGHT 2006 ACS on STN

141:370229 Controlled-release nano-diffusion delivery systems for cosmetic and pharmaceutical compositions. Gupta, Shyam K. (USA). U.S. Pat. Appl. Publ. US 2004208902 A1 **20041021**, 9 pp. (English). CODEN: USXXCO. APPLICATION: US 2003-418495 20030418.

AB The present invention discloses the utilization of zeolites for controlled-release of cosmetic and pharmaceutical compns. by nano-diffusion technol. The treatment and protection of skin surface requires that certain compns. be delivered to the skin surface and allowed to remain on the skin surface for as long as possible before such ingredients are absorbed into deeper layers of skin and carried into the bloodstream. Zeolites do not absorb into the skin, which is useful for topical delivery of cosmetic and pharmaceutical compns., for example antiaging, anti-wrinkle, antioxidants, skin whitening, acne treatment, rosacea treatment, sun screens, UV blocks, anesthetics, skin soothers, anti-irritants, anti-inflammatory agents, vitamins, hormones, and such that are electronically attached to the outer surfaces of such zeolites and are released to the outer surface of skin by a diffusion-controlled thermodyn. process. An anhyd. face mask controlled-release antiaging compn. with heat-releasing effect. comprises magnesium sulfate (anhyd.) 30.0, glycerin 49.0, sodium potassium aluminosilicate (Zeolite A3) 20.0, an antiaging compn. (an equal wt. mixt. of tetrahydrocurcumin, niacinamide lactate, copper ATP complex, glutathione, and carnosine)1.0%.

L35 ANSWER 6.OF 6 HCA COPYRIGHT 2006 ACS on STN

141:195281 Topically bioavailable acne and rosacea treatment
compositions. Gupta, Shyam K. (USA). U.S. Pat. Appl. Publ. US
2004156873 A1 **20040812**, 10 pp. (English). CODEN: USXXCO.
APPLICATION: US 2003-248691 20030210.

AB The present invention relates to acne and rosacea compns. by a
six-prong synergistic combination treatment strategy that includes
(1) control of excess sebum prodn., (2) control of undesirable
bacteria or mites, (3) control of inflammation, (4) enhanced
desquamation of follicular infundibulum cells, (5) redn. of
irritation from anti-acne or rosacea compns. themselves, and (6)
enhancement of the topical bioavailability of anti-acne and rosacea
compns. This is achieved by a synergistic combination of commonly
utilized topical anti-acne and rosacea ingredients with a topical
bioavailability enhancement compn., which results in enhanced
anti-acne and rosacea action from such ingredients. Moreover,
addnl. inclusion of an anti-inflammatory compn., and also a vascular
micro-circulation enhancement compn., further results in synergistic
superior anti-acne and rosacea benefits from such compns. The
present invention discloses addnl. surprising synergistic
combinations for the control of acne and rosacea that are suitable
for a variety of delivery systems and packaging forms. For example,
a facial mask contained chitosan 5.0%, lactic acid 5.0%, glycerin
18.%, water 70.6%, yohimbine-HCl 0.5%, niacinamide lipoate 0.5%,
glutathione 0.2%, and preservatives 0.5%. Chitosan, lactic acid and
glycerin were mixed to a paste. Other ingredients were mixed sep.
to a clear soln. The soln. was added to main batch and mixed. A
clear gel product obtained was applied on the face and neck and left
for 10 to 30 min, then rinsed off.

145:110414 Concurrent enhancement of skin penetration of organic base
 active agents and organic hydroxy acid active agents as their
 ion-pair complexes. Gupta, Shyam K. (Bioderm Research, USA). U.S.
 Pat. Appl. Publ. US 2006147508 A1 20060706, 15 pp., Cont.-in-part of
 U.S. Ser. No. 439,349. (English). CODEN: USXXCO. APPLICATION: US
 2006-307729 20060218. PRIORITY: US 2002-265000 20021004; US
 2002-280519 20021025; US 2002-290933 20021107; US 2003-394851
 20030322; US 2003-439349 20030515.

AB This invention relates to concurrent enhancement of skin penetration
 of certain org. nitrogen heterocyclic base active agents and certain
 org. acid active agents, esp. org. hydroxy acids. This concurrent
 enhancement of skin penetration also provides enhanced
 bioavailability of both org. nitrogen heterocyclic base active agent

and org. hydroxy acid active agent. The org. nitrogen heterocyclic base active agents and org. hydroxy acid active agents are first combined to form an ion-pair complex, which includes an in-situ mixing process, and said ion-pair complex is applied topically, whereupon said ion-pair complex undergoes enhanced skin penetration and upon reaching uppermost living part of skin and having reached therein the physiol. pH of 7.4, said ion-pair complex dissocs. to release its constituent org. nitrogen heterocyclic base active agent and said org. acid active agent in a bioavailable form.

20031226.

AB A nonaq. gel compn. for tooth whitening, comprises: (A) a tooth
whitening component of 17.0 to 43.0 specific inductive capacity
(25°C) and 0 to 7000 kPa vapor pressure (25°C), (B) a
substance that is sol. in the tooth whitening component and is pptd.
by an aq. soln. of calcium chloride, and (C) a gelling agent. The
compn. contains substantially none of water and peroxides. This
tooth whitening component can penetrate into the enamel surface
layer of teeth to thereby alter the optical properties, such as
refractive index and reflectance, of the enamel so that the enamel
is apparently whitened. The whitened teeth can be restored to the
original tooth color in a reversible manner in the presence of
water. Further, the persistence of reversible whitening effect can
be strikingly enhanced by the nonaq. gel compn. For example, a
tooth-whitening gel compn. contained propylene glycol 43.5,
isopropanol 24.99, ethanol 24, Ultrahold strong 1, Na lauryl sulfate

3, myristic acid diethanolamide 1, carboxyvinyl polymer 1, flavors 1, NaOH 0.01, and stevioside 0.5 %.

141:194959 Skin firming anti-aging cosmetic compositions. Gupta, Shyam K. (USA). U.S. Pat. Appl. Publ. US 2004161435 A1 **20040819**, 12 pp. (English). CODEN: USXXCO. APPLICATION: US 2003-248753 20030214.

AB Cosmetic mask compns. suitable for face, neck, chin or body applications are disclosed. These compns. synergistically combine at least 1 skin beneficial cosmetic or pharmaceutical compn. with at

least one compn. to promote excess fat redn., cellulite control, or muscle toning benefits. The mask compn. also contains at least one binder compn. that binds with other beneficial ingredients by electrostatic, at., or ionic charges to synergistically enhance their topical site-specific benefits. These mask compns. are suitable for a variety of delivery system methods that include, e.g., peel-off mask, leave-in mask, moisturizing mask, and exfoliating mask. Thua, a facial mask compn. contained chitosan 5.0, lactic acid 5.0, glycerin 18.0, water 65.8, hydroxycitric acid 5.0, niacinamide 0.5, glutathione, and preservatives 0.5%.

L36 ANSWER 6 OF 21 HCA COPYRIGHT 2006 ACS on STN

141:76379 Lanolin-free cosmetic compositions containing an aromatic ester of a hydroxy fatty acid. Filippi, Vanina; Salem, Sophie; Auguste, Frederic (L'oreal, Fr.). Fr. Demande FR 2848823 A1 **20040625**, 24 pp. (French). CODEN: FRXXBL. APPLICATION: FR 2002-16533 20021223.

AB A cosmetic makeup compn. free from lanolin or its derivs. contains at least a liq. ester resulting from the esterification of an arom. acid with a hydroxy fatty acid. This compn. makes it possible to give a shining deposit on keratins. The aliph. hydroxy compd. is a hydroxy fatty acid such as ricinoleic acid or hydroxystearic acid. The compn. contains a pasty compd. having a hardness at 25° ranging 0.001-0.5 MPa, preferably 0.002-0.4 MPa, and whose liq. fraction at 23° lies between 9 and 97% in wt. Thus, a rouge formulation contained Finsolv BCO 22, Elfacos ST9 11, 2-decyltetradecanoic acid triglyceride 20, hydrogenated **polyisobutene** 10, diisostearyl malate 11, **polybutylene** 2.5, octacosanyl stearate 5, triglyceride mixt. from lauric, myristic, palmitic, and stearic acids 2, **polyethylene** wax 5, and modified Hectorite 3%, pigments and preservatives and perfume qs.

141:28686 Pharmaceutical composition for transdermal or transmucosal administration comprising at least one progestin and/or at least one estrogen, process for preparing it and uses thereof. Masini-Eteve, Valerie; Taravella, Brigitte (Besins International Belgique, Bulg.). U.S. Pat. Appl. Publ. US 2004110732 A1 **20040610**, 8 pp. (English). CODEN: USXXCO. APPLICATION: US 2003-393077 20030320. PRIORITY: FR 2002-15586 20021210.

AB The present invention relates to a novel pharmaceutical compn. for transdermal or transmucosal administration, comprising at least one

progestin, and/or at least one estrogen, at least one percutaneous absorption promoter which is a hydroxy acid or a pharmaceutically acceptable salt of a hydroxy acid. The compn. is administered to treat physiol. conditions, such as disorders of the cycle or disruptions in the menstrual regularity, premenstrual syndrome, mastodynia, functional ovarian cysts, mittelschmerz syndrome, and dysmenorrhea. For example, a gel was formulated contg. gestodene 0.06, 17 β -estradiol 0.12, 95 % ethanol 40, Carbopol 980 0.5, Lutrol F127 10, lactic acid 5, triethanolamine 1.5, and purified water balance to 100 %.

 URL: <http://mdpi.org./molecules/papers/30200035.pdf> Publisher:
 Molecular Diversity Preservation International.

AB A practical synthesis of the title compds. has been developed. The
 salient features of the synthesis are (1) use of easily accessible
 starting materials viz. **aleuritic acid**,
 10-undecenoic acid, cycloheptanone etc. and (2) fixation of the
 required **olefinic** geometry via Wittig and acetylenic
 routes.

128:208784 Cosmetic and/or dermatological acid composition containing poly(2-acrylamido-2-methylpropane sulfonic acid) crosslinked and neutralized to at least 90%. Dupuis, Christine; Hansenne, Isabelle; Maubru, Mireille; Sebillotte, Arnaud Laurence; Lorant, Raluca (L'Oreal S. A., Fr.). Fr. Demande FR 2750326 A1 **19980102**, 19 pp. (French). CODEN: FRXXBL. APPLICATION: FR 1996-8108 19960628.

AB Cosmetic and/or dermatol. compns. having an aq. acid medium contain ≥ 1 poly(2-acrylamido-2-methylpropanesulfonate) which is crosslinked and $\geq 90\%$ neutralized. The compns. are characterized in that the pH of the aq. medium ≤ 5 and preferably 1-4 and the polymer is crosslinked with ≥ 1 monomer having ≥ 2 **olefinic** double bonds. The compns. may be used in shampoos or hair-care products; hygienic products; cosmetics; sunscreens; non-therapeutic cosmetics for the skin, scalp, eyelashes, eyebrows, nails or mucus membranes; or non-therapeutic products for depigmentation of the face or body. The compns. may also be used to thicken or form gels for dermatol. ointments. Thus, 2-acrylamido-2-methylpropanesulfonic acid was polymd. and neutralized with NH_3 and then crosslinked with trimethylolpropane triacrylate to give a neutralized crosslinked polymer having hydrodynamic radius 440 nm. The prepd. crosslinked polymer was used to prep. a thick, transparent stable gel sunscreen.

L36 ANSWER 17 OF 21 HCA COPYRIGHT 2006 ACS on STN
104:205774 Comparative examinations of the apple variety Jonagold and
its parents Jonathan and Golden Delicious. Neubeller, J.; Buchloh,
G. (Inst. Obst-, Gemuese- und Weinbau, Univ. Hohenheim, Stuttgart,
D-7000, Fed. Rep. Ger.). Mitteilungen Klosterneuburg, 36(1), 34-46
(German) **1986**. CODEN: MIKLD4. ISSN: 0250-4944.

AB The fruit pulp and skin of Jonagold, Jonathan, and Golden Delicious
apples were studied. The compactness of pulp and skin changed
rapidly during maturation in all 3 varieties. Jonagold had a medium
decrease in wt. from water losses under lab. conditions. The wax
content was low with young fruit; Jonagold had a medium skin wax
content. The major paraffin was nonacosane (C29) [630-03-5], which
was 46% in Jonagold. There were more unsatd. fatty acids than satd.
ones, and Jonagold was more like Golden Delicious than Jonathan.
Jonagold had a medium wt. of membrane. In the cutin
9,10,18-trihydroxystearic acid [496-86-6] and 10,16-
dihydroxyhexadecanoic acid [3233-90-7] were the main components.
Jonagold had a medium acidity, and malic acid [6915-15-7] was
93-95% of the total. The total sugar content of the pulp was 36-72%
dry substance according to variety and stage of development. The
highest amt. of aroma substances were produced by Jonagold. The
organoleptic judgement shows more compact fruit pulp in Jonagold,
and the taste was a refreshing-harmonic one compared to those of its
parents.

54:109978 Original Reference No. 54:20866i,20867a-i,20868a-c Organic reactions in strong alkalis. IV. Rearrangement and fission of acids with α -glycol and other vicinal oxygen functions. Dytham, R. A.; Weedon, B. C. L. (Imp. Coll. Sci. Technol., London). Tetrahedron, 9, 246-53 (Unavailable) **1960**. CODEN: TETRAB. ISSN: 0040-4020.

AB cf. CA 54, 19471a. On treatment with strong alkali threo-(I) and erythro-9,10-dihydroxystearic acids (II) and the corresponding hydroxyoxo (III) and dioxo acids (IV) gave high yields of α -hydroxy- α -octylsebacic acid (V). Under more vigorous conditions 9-oxoheptadecanoic acid (VI) was formed and hydrolyzed to octanoic (VII), nonanoic (VIII), and azelaic acids (IX) as main products. KMnO_4 oxidn. of oleic acid gave II and HCO_3H . Hydroxylation of oleic and 10-undecenoic acid gave I and 10,11-dihydroxyundecanoic acid (X), resp. AcO_2H hydroxylation of Me ricinoleate and subsequent hydrolysis yielded 9,10,12-trihydroxyoctadecanoic acid (XI). Oxidn. of the corresponding dihydroxyacid with N-bromosuccinimide gave 9,10-dioxooctadecenoic acid (XII), reduced by Zn and AcOH to a mixt. (XIII) of 9-hydroxy-10-oxo- and 10-hydroxy-9-oxooctadecanoic acids; Me ester, ν 3470, 1735, 1715 cm^{-1} Crystn. of natural material from dil. MeOH yielded β - **aleuritic acid** (XIV), m. $100-1^\circ$. I (3.5 g.) and 10 g. 1:1 finely powd. KOH-NaOH . heated 1 hr. at $230-40^\circ$ and the cooled mass taken up in H_2O , acidified, and the product isolated with Et_2O gave 3.3 g. V, m. $110-11^\circ$, oxidized with KMnO_4 to VI, m. $79.5-80.5^\circ$; Me ester m. $43-4^\circ$, ν 1715, 1735 cm^{-1} With temps. of $200-60^\circ$, the yield of V varied from 40 to 80%. I (4.6 g.) autoclaved in stainless steel (N atm.) 2 hrs. at 300° with 12 g. KOH in 2 ml. H_2O with evolution of H and formation of 4.5 g. acidic product and the acid fractionally crystd. from dil. MeOH and CHCl_3 -petr. ether yielded 40% V. XIII (1.03 g.) and 5 g. 1:1

KOH-NaOH heated 30 min. at 230° and the product (1.04 g., contg. 1, 5, and 7% VII, VIII and IX by gas liquid chromatography) recrystd. from CHCl₃-petr. ether yielded 52% V. XIII (0.76 g.) in 50 ml. 50% alc. KOH refluxed 10 hrs. and concd. to 20 ml., dild. with 50 ml. H₂O and acidified with 2N H₂SO₄, steam-distd. to give 48 mg. acidic fraction contg. 9:91 VII-VIII, and the washed (hot H₂O) and dried (Et₂O) residual oil crystd. gave 0.16 g. V. The aq. mother liquors contained 60 mg. IX. XIII (1.7 g.) in 100 ml. 10% aq. KOH and then 20 ml. H₂O added successively in 1.5 hrs. with stirring to 5 g. KOH and then 20 ml. H₂O added successively in 1.5 hrs. with stirring to 5 g. KOH and 5 ml. H₂O in a Cu vessel at 250°, the distillate extd. with Et₂O, and the ext. evapd. gave 50 mg. 3:2 nonanol-nonanal. The distn. residue worked up yielded 0.5 g. V. XII (1.02 g.) and 4 g. 1:1 KOH-NaOH heated 15 min. with a few drops of H₂O at 160° and the cooled melt taken up in H₂O, acidified and the acid soln. steam-distd. to give 4% VIII, the residual oil washed in hot H₂O, and dried in Et₂O yielded 0.75 g. V. The aq. mother liquors contained 4% IX. II (2.3 g.) and 7 g. KOH heated 1 hr. at 260-70° and the cooled mass taken up in H₂O, the acidified soln. extd. with petr. ether and Et₂O, and the product crystd. (petr. ether or dil. MeOH) gave 0.57 g. VI. I (1.2 g.) and 6 g. KOH in 10 ml. H₂O heated 2 hrs. in a stainless steel autoclave (N atm.) at 340° with evolution of H and the cooled mixt. worked up gave 1.05 g. acidic product, crystd. (dil. MeOH) to give 0.14 g. VI. Considered in conjunction with the previous results of Le Sueur and Withers (CA 9, 603), the above transformations and the close similarity between the final products from VI and those from I and II clearly indicated that fission of I and II proceeded by the successive formation of V and VI by a benzilic acid type of rearrangement. X (3.3 g.) and 9 g. KOH heated 1 hr. at 300° and the rapidly cooled mixt. taken up in 300 ml. H₂O, the soln. acidified with evolution of CO₂, and extd. with Et₂O gave 3.1 g. acidic product, m. 125-7°, analyzed by gas liquid chromatography of the Me esters to show the presence of 95% sebacic acid, 5% VIII, and a trace of suberic acid. XI (1.28 g.) and 5.2 g. KOH heated 1 hr. at 300° (N atm.) and the neutral product carried over by the gas stream condensed at 0°, taken up in Et₂O, and the oily product (65 mg.) analyzed by gas-liquid chromatography on **polyethylene** adipate at 130° showed the presence of 94:6 2-octanol-2-octanone. Isolation of the acidic products and fractional crystn. from H₂O gave IX. XI (6.4 g.) in 50 ml. 30% KOH added with stirring in 90 min. to 10 g. KOH at 300° in a Cu vessel and the distillate condensed to yield 0.8 g. mixt. of 79:21 2-octanol-2-octanone, [α]_D²⁴ 0.13° (alc.), the acidic products isolated, and the dicarboxylic acids fractionally sepd. by crystn. from H₂O gave mixts. similar to those of 1 hr. alk. fusion at 300° (acidic products and yield in moles given): monocarboxylic acids, C₇ 0.25

(0.32), C8 0.08 (0.12), C9 0.04 (0.04); dicarboxylic acids, C8 0.13 (0.11), C9 0.47 (0.46). In view of the O function at C-12, the fission of XI probably involved β -hydroxyketone or β -diketone intermediates with fission at the 10,11- and 11,12-bonds predominating. Initial dehydrogenation of the C-12 OH group and fission to give $\text{HO}_2\text{C}(\text{CH}_2)_7\text{CH}(\text{OH})\text{CHO}$ and 2-octanone would also favor the formation of IX. XIV fused 1 hr. with KOH at 250° and the acid product triturated with Et_2O gave 7-pentadecenone-1,15-dioic acid, m. $103-4^\circ$; Me ester, ν 1715, 1735 cm^{-1} . Fractional pptn. of the acidic product from another expt. with petr. ether and crystn. of the solid product from CHCl_3 -MeOH and from H_2O gave $\text{HOCH}_2(\text{CH}_2)_5\text{C}(\text{OH})(\text{CO}_2\text{H})(\text{CH}_2)_7\text{CO}_2\text{H}$, m. $143-4^\circ$. XIV, $\text{HOCH}_2(\text{CH}_2)_5\text{CH}(\text{OH})\text{CH}(\text{OH})(\text{CH}_2)_7\text{CO}_2\text{H}$, was dehydrogenated in 1 hr. at 300° by alk. fusion to give approx. equimolar amts. of hexanoic, octanoic, pimelic, and azelaic acids (acids and yields in moles given): hexanoic, 0.16, 0.23, 0.14, 0.19, 0.22 (2.5 hrs. reaction time); octanoic, 0.16, 0.23, 0.13, 0.19, 0.20; pimelic, 0.17, 0.22, 0.15, 0.16, 0.22; IX, 0.15, 0.24, 0.14, 0.17, 0.23. A branched chain or cyclic dicarboxylic acid of higher mol. wt. was also formed simultaneously in yields up to 40%.

Extension of the isoprene rule. Mitter, P. C.; Bagchi, Phanindra Nath J. Indian Chem. Soc., 16, 402-4 (Unavailable) 1939.

AB By assuming that larger mols. can be formed from isoprene by head-to-tail union followed by addn. of H_2O at a conjugated double bond at 1 end of a chain, partial or complete hydrogenation and removal of side-chain Me groups by oxidn., and partial or complete oxidn. of the terminal groups, the formation of a large no. of long-chain aliph. mono- and di-basic acids can be explained. The close connection of farnesol with sabinic acid suggests that juniperic acid and thapsic acid are similarly related to a diterpene, $\text{C}_{20}\text{H}_{32}$. Incomplete hydrogenation of the unsatd. system of the intermediate alc. and suitable oxidn. would lead to ambrettolic acid and epiambrettolic acid (closely related to **aleuritic acid**, present in shellac resin).

127:92398 Manufacture of aleuritic acid from **seed** lac: some practical considerations. Rao, L. Jagan Mohan; Srinivas, P.; Gurudutt, K. N. (Central Food Technological Research Institute, Mysore, 570 013, India). Journal of Scientific & Industrial Research, 56(3), 164-167 (English) **1997**. CODEN: JSIRAC. ISSN: 0022-4456. Publisher: National Institute of Science Communication.

AB The industrial process for manufg. aleuritic acid from **seed** lac poses certain problems like the long sapon. period, need for reprocessing the crude product and the inevitable loss during this step. Some improvements are suggested to overcome these problems and get threo-aleuritic acid of 92% purity in an optimized yield of 23%. A simple step of crystn. of the crude Na **aleuritate**

from water was introduced which effectively removes gummy pigments and other nonvolatiles. A gas chromatog. assay procedure for detg. its purity is developed.
